

BookMe AI — Revenue → Cost → Profit Schema

Distilled from `cursor_temporary_docs/app-overview.md` §§3–5. Only sources that are **contractually committed** are included — speculative future revenue (§3.3) is excluded. Nothing here is in production with paying Tenants today; the schema describes the model the codebase is being built towards.

Absolute net profit, per Period (currently 1 calendar month)

For one billing Period:

Revenue

= for every Tenant, take (R1 + R2 - R3), then add up all Tenants

Variable cost

= for every Tenant, take (C1 + C2 + C3 + C4), then add up all Tenants

Fixed cost

= C5 + C6 + C7/12 + C8 + C9

Acquisition cost

= C10 + C11 + C12 + C13 + C14

One-off cost

= C15 + C16 + C17 + C18 + C19

Labour cost

= C20 + C21 + C22

NET PROFIT

= Revenue

- Variable cost

- Fixed cost

- Acquisition cost

- One-off cost

- Labour cost

Pass-through Costs P1 (WhatsApp messaging) and P2 (Tenant's Google Workspace) are **deliberately absent** — they are paid by the Tenant directly and never hit BookMe AI's books under today's credential-paste model (see §4.7 / §9). C7 is divided by 12 because the domain is billed annually but Periods are monthly.

Diagram

Each cost group flows into the same destination — the Period's net profit. Revenue is added (green); costs are subtracted (neutral).

Schema at a glance

Revenue (R1 · R2 · R3)

R1 Subscription Fee per Tier per Period (includes Token Allowance).

R2 Token Overage = provider unit price + Markup (cost-plus).

R3 Promotional discount adjustments (negative revenue).

Costs (C1 – C22)

Variable C1–C4 — scale with Tenants & traffic.

Fixed C5–C9 — paid at zero Tenants.

Acquisition C10–C14 — bounded by our decision.

One-off C15–C19 — milestone / legal.

Labour C20–C22 — paid only.

Profit (three views)

Per-Tenant gross margin — Tenant's revenue minus the variable costs that Tenant caused.

Platform contribution margin — total revenue minus all variable & fixed costs.

Net profit — contribution margin minus acquisition, one-off and labour.

1 · Revenue sources

Recognised when the corresponding Revolut payment transitions to **COMPLETED** (§3.1). Refunds and chargebacks are negative revenue in the Period in which they are processed. Nothing in the schema is in production with paying Tenants today — these rows describe the contractual model the codebase is being built towards.

ID	Source	Trigger	Cadence	Sign
R1	Subscription Fee for the Tenant's Tier (incl. Token Allowance)	Successful Hosted Checkout charge for the Period	Per Period · per Tenant	+
R2	Token Overage — provider unit price + Markup	Cumulative Tokens in Period exceed the Allowance	Within / at close of Period	+
R3	Promotional discount adjustments	Tenant applies a valid discount code at checkout	Per applicable invoice	–

2 · Cost categories

2.1 Variable software costs (proportional to usage)

ID	Cost	Vendor	Trigger	On our books?
C1	LLM inference (input + output Tokens)	Google AI · OpenAI	Each model invocation in <code>processWhatsAppMessage</code>	Yes
C2	Automated outbound email	Resend	Each transactional email sent automatically	Future
C3	Payment processing fees	Revolut Merchant	Each successful Hosted Checkout charge	Yes
C4	Refund / chargeback fees	Revolut Merchant	Each refund or chargeback	Yes

2.2 Fixed software & infrastructure (incurred at zero Tenants)

ID	Cost	Vendor	Cadence
C5	Application hosting & functions	Vercel	Per-Period plan + overage
C6	Managed Postgres	Supabase	Per-Period plan + overage
C7	Domain registration & DNS	Registrar	Annual
C8	Sender domain reputation / deliverability	Registrar + Resend	Annual + per-Period (when email ships)
C9	Third-party developer accounts (Google, Meta, OpenAI, Twilio, Revolut, Supabase, Vercel)	Each platform	Free today; paid above thresholds

2.3 Acquisition (none active today — bounded by our decision)

ID	Cost	Vendor	Trigger
C10	Paid social ads (incl. Click-to-WhatsApp)	Meta Ads	Per impression / click / conversion
C11	Paid search ads	Google Ads	Per click / conversion
C12	Content & SEO production (paid)	Contractors	Per piece commissioned
C13	Sales, partnerships & affiliate commissions	Partner agreements	Per signed deal / converted Tenant
C14	Local listings / directories (paid)	Industry directories	Per listing / renewal

2.4 One-off (recognised on payment, often amortised)

ID	Cost	Vendor	Trigger
C15	Meta Business Verification fees (where applicable)	Meta	Per submission cycle
C16	Google OAuth app verification fees (where applicable)	Google	Per submission cycle
C17	WhatsApp display-name approval (where applicable)	Meta / Twilio	Per submission
C18	Legal review (privacy, ToS, data deletion)	External counsel	Per material change
C19	Branding / design assets	Contractors	Per asset commissioned

2.5 Labour (paid only)

ID	Cost	Source	Trigger
C20	Engineering, product & design	Hires / contractors / agencies	Per Period or per engagement
C21	Manual outbound email (human-sent)	Hires / contractors / agencies	Per email or per Period
C22	Customer support, success & operations	Hires / contractors / agencies	Per Period or per ticket

3 · Three profit views (\$5.1)

Per-Tenant gross margin	Platform contribution margin	Net profit
For ONE Tenant, in one Period: GROSS MARGIN = (R1 + R2 - R3) - (C1 + C2 + C3 + C4) R2 is structurally cost-plus, so every Token above the Allowance contributes exactly the Markup.	For ALL Tenants combined, in one Period: CONTRIBUTION = total Revenue from Tenants - total Variable cost (across Tenants) - (C5 + C6 + C7/12 + C8 + C9) Per-Tenant margin can be positive while contribution margin is still negative, because fixed costs are paid at zero Tenants.	For the whole platform, in one Period: NET PROFIT = Contribution margin - (C10 + C11 + C12 + C13 + C14) acquisition - (C15 + C16 + C17 + C18 + C19) one-off (C18) - (C20 + C21 + C22) labour Steerable: pause C10-C11 and net profit rises without changing the product.

4 · Properties baked into the formula

Markup R2 gross-margin contribution per overage Token	C5..C9 Floor that must be cleared before net profit > 0
0 Pass-through (P1, P2) contribution to net profit	Trial Consumes C1 + share of C5..C9 with R1 = 0 in that Period

5 · Explicitly excluded from the formula

Item	Why it's not in net profit
P1	WhatsApp messaging — Tenant pays Meta/Twilio directly under their own credentials. Migrates into C2.x only if BookMe AI becomes a Meta Solution Partner or moves to Twilio Sub-accounts (\$9).
P2	Tenant's Google Workspace — unrelated to use of BookMe AI; a free @gmail.com works end-to-end (\$9.3).
Future revenue (\$3.3)	Per-channel add-ons, annual prepay, paid setup, white-label, profession packs, referrals — listed but not yet committed, so excluded from the certain schema.
